ACCURACY ANALYSIS ON LARGE BLOCKS OF HIGH RESOLUTION IMAGES

Dr. Ing. Ricardo M. Passini
BAE SYSTEMS ADR
• INTRODUCTION
• SHORT DESCRIPTION OF THE ORIENTATION MODELS
• EXPERIMENTAL TESTS
• ANALYSIS OF THE RESULTS
• CONCLUSIONS
• RECOMMENDATIONS
“TODAY EXISTING HIGH RESOLUTION IMAGES ARE ENTERING INTO COMPETITION WITH AERIAL PHOTOGRAPHY FOR REGIONAL MAPPING PROGRAMS AND OTHER EXTENSIVE MAPPING APPLICATIONS WHERE HIGH RESOLUTION IS REQUIRED”

OUR STUDY IS CONCENTRATED MAINLY ON QUICKBIRD IMAGES
USE OF VERY HIGH RESOLUTION IMAGES

Mapping, Risk Management, Forest, Geology, Regional Planning, Utility Corridor Planning, Mapping for E911 applications, Defense Mapping, etc.

1. Information contents

Rule of thumb: for topographic maps 0.05 – 0.1 mm pixel size in map required
- based on 1m pixel size $\rightarrow$ map 1 : 10 000 ($\sim 1^\prime\prime=800^\prime$)
- based on 0.6m pixel size $\rightarrow$ map 1 : 6000 ($1^\prime\prime=500^\prime$)

For orthoimages 8 pixel / mm (0.125 m pixel size)
- based on 1m pixel size $\rightarrow$ orthoimage 1 : 8000 ($\sim1^\prime\prime=667^\prime$)
- based on 0.6m pixel size $\rightarrow$ orthoimage 1 : 4800 ($1^\prime\prime=400^\prime$)

2. Accuracy

Required accuracy of x, y- coordinates: $\sim 0.25$mm in map, in orthoimage $\sim 0.3$mm

$\rightarrow$ required ground accuracy 2.5m / 1.5m (0.25 mm at above map scales)

Image orientation must be better because of additional error components
ACCURACY DEPENDS ON:

- Orientation Model used
- GCPs (Number, Distribution, Geometric & Radiometric Quality, etc.)
- For Orthos (DTM accuracy, Resolution, Fidelity of Terrain Reconstruction, etc)
- Others

USED ORIENTATION MODELS IN THE INVESTIGATION:

- SIMULTANEOUS BUNDLE BLOCK ADJUSTMENT (using ephemeris & quaternion algebra)
- RATIONAL POLINOMIAL COEFFICIENTS (+image correction functions)

USED IMAGE:

- A block of 40 QB Basic images with limited overlap (hilly, equatorial, jungle zone)

GROUND CONTROL:
Manually Transferred from existing oriented aerial photography (1:20,000)
Bundle Orientation using ephemeris and quaternion algebra

It is possible to use quaternion multiplication to perform a rotation about an arbitrary unit axis \( \mathbf{m} \) by an angle \( \Theta \). The quaternion that computes the rotation is:

\[
q = (a, v) \quad \text{Where } a = \cos(\Theta/2), \quad v = \sin(\Theta/2).
\]

Then \( q_1 = \mu_x \sin(\Theta/2), \quad q_2 = \mu_y \sin(\Theta/2), \quad q_3 = \mu_z \sin(\Theta/2), \quad q_4 = \cos(\Theta/2) \)

A point in 3D \( p = (0, \vec{P}) \) \( q = a + bi + cj + dk \)
is rotated by \( p_{\text{rotated}} = q^*p^*q^{-1} \)

The orthogonal rotation matrix corresponding to a rotation by the unit quaternion \( p = a + bi + cj + dk \) is given by \( q^*q^{-1} = \)

\[
\begin{align*}
q^*q^{-1} &= \begin{bmatrix}
a^2 + b^2 - c^2 - d^2 & 2bc - 2ad & 2ac + 2bd \\
2ad + 2bc & a^2 - b^2 + c^2 - d^2 & 2cd - 2ab \\
2bd - 2ac & 2ab + 2cd & a^2 - b^2 - c^2 + d^2
\end{bmatrix}
\end{align*}
\]

Assuming smooth stable paths (that generally is), then no ephemeris corrections are applied, only attitude corrections are computed in the adjustment.
Bundle Orientation using ephemeris and quaternion algebra
The QB Camera Sensor Model includes the Coordinate Systems:

- **ECEF Spacecraft Coord. System**
  - $q_E^S(t)$
  - Rotation + Shift ($\alpha, Sh_X, Sh_Y$)

- **Camera Coord. System**
  - $q_C^S$ (Fixed)
  - 1 to 1 relation. No image distortion in Level 1B

- **Spacecraft Coord. System**
  - $X_S$ (Direction of scan)
  - $Y_S$
  - $Z_S$ (Towards target)

- **Detector Coord. System**
  - $X_D$ (Direction of scan)
  - $Y_D$
  - $Z_D$ (Towards LOS)
  - Detector column numbers

- **Image Coord. System**
  - Column numbers
  - Row numbers
  - (N-1, M-1)
As the Level 1B product is sampled at a constant rate, the corresponding time \( t = \frac{r}{\text{avgLineRate}} + \text{firstLineTime} \)

One point on the imaging ray is the perspective centre of the virtual camera at time \( t \). The coordinates of the perspective centre in the spacecraft coordinate systems are constant and given data. In matrix notation: \( \mathbf{C}_S = (\mathbf{C}_X, \mathbf{C}_Y, \mathbf{C}_Z)^T \) (from *.geo file)

It is possible to locate the origin of the spacecraft coordinate system in the ECF system at a time \( t \) by interpolating the position time series in the ephemeris file. Let us call this position \( \mathbf{S}_E(t) \). Likewise, we can find the attitude of the spacecraft coordinate system at a time \( t \) in the ECF system by interpolating the quaternion time series in the attitude file. This quaternion, \( \mathbf{q}_E^S(t) \), represents the rotation from the ECF system to the spacecraft body system at time \( t \). Then using quaternion algebra, the position of the perspective centre at time \( t \) in the ECF coordinate system is:

\[
\mathbf{C}_E(t) = (\mathbf{q}_E^S(t))^{-1} \mathbf{C}_S \mathbf{q}_E^S(t) + \mathbf{S}_E(t), \quad \text{or}
\]

\[
\mathbf{C}_E(t) = \mathbf{q}_E^S(t) \mathbf{C}_S (\mathbf{q}_E^S(t))^{-1} + \mathbf{S}_E(t) \quad \text{or} \quad \mathbf{C}_E(t) = \mathbf{R}_E^S(t) \mathbf{C}_S + \mathbf{S}_E(t)
\]

This is the Projection Center if ECEF

Any point that we measure \((c, r)\) is expressed in the detector system as

\[
\mathbf{X}_D = 0, \quad \mathbf{Y}_D = -c \cdot \text{detPitch} \quad \text{(detPitch: Calibrated distance between pixels)}
\]

In the camera system:

\[
\mathbf{X}_C = \cos(\alpha) \cdot \mathbf{X}_D - \sin(\alpha) \cdot \mathbf{Y}_D + \mathbf{S}_X;
\]

\[
\mathbf{Y}_C = \sin(\alpha) \cdot \mathbf{X}_D + \cos(\alpha) \cdot \mathbf{Y}_D + \mathbf{S}_Y; \quad \mathbf{Z}_C = \mathbf{C} \quad \text{(Nominal Principal Distance)}
\]

As Level 1B images do not have lens distortion the image point is identical to the measured image point, hence: \( \mathbf{X}_C = \mathbf{X}_C, \mathbf{Y}_C = \mathbf{Y}_C, \mathbf{Z}_C = \mathbf{Z}_C \).

The unit vector \( \mathbf{w}_C \) that is parallel to the external ray in the camera coordinate system is just the position of \((\mathbf{X}_C', \mathbf{Y}_C', \mathbf{Z}_C')\) relative to the perspective centre at \((0, 0, 0)\), normalized by its length. In matrix notation, this vector is: \( \mathbf{w}_C = (\mathbf{X}_C', \mathbf{Y}_C', \mathbf{Z}_C')^T \) & \( \mathbf{w}_C = \mathbf{w}_C / \| \mathbf{w}_C \| \)

It is possible to convert this vector first to the spacecraft coordinate system and then to the ECF system. The unit quaternion for the attitude of the camera coordinate system, i.e., the quaternion for the rotation of spacecraft frame into the camera frame \( \mathbf{q}_S^C \), is in the geometric calibration file (*.geo). Then, using quaternion algebra:

\[
\mathbf{w}_E = \mathbf{q}_S^E(t)^{-1} \mathbf{q}_S^C \mathbf{w}_C \quad \text{or} \quad \mathbf{w}_E = \mathbf{q}_S^E(t) \mathbf{q}_S^C \mathbf{w}_C (\mathbf{q}_S^E(t) \mathbf{q}_S^C)^{-1}
\]

or using matrix algebra, \( \mathbf{w}_E = \mathbf{R}_E^S(t) \mathbf{R}_S^C \mathbf{w}_C \)

Hence, the co-linearity equation will be:

\[
\mathbf{w}_C = [\mathbf{R}_E^S(t) \mathbf{R}_S^C] \mathbf{w}_E \quad \text{or} \quad \mathbf{w}_C = (\mathbf{q}_S^E(t) \mathbf{q}_S^C)^{-1} \mathbf{w}_E [\mathbf{q}_S^E(t) \mathbf{q}_S^C]^T
\]
Bundle Orientation using ephemeris and quaternion algebra

Ephemeris and Quaternion data. Variance-Co-variance Matrix

– **Ephemeris File**: Sample mean and covariance estimates of the position of the spacecraft system relative to the ECEF system. These data are produced for a continuous image period, e.g., an image strip, and spans the period from at least 4 seconds before start of imaging to at least four seconds after the end of imaging.

– **Attitude File**: Contains Sample mean and covariance estimates of the attitude of the spacecraft system relative to the ECEF system. These data are also produced for a continuous image period, e.g., an image strip, and spans the period from at least 4 seconds before start of imaging to at least four seconds after the end of imaging.

– **Sampling rate** (timeInterval): Each 0.02 seconds. For intermediate position only linear interpolation is required.

– **Possibility to implement a weighting schema based on**:

\[
\begin{array}{cccc}
\sigma X_0^2 & \sigma X_0 Y_0 & \sigma X_0 Z_0 \\
\sigma Y_0^2 & \sigma Y_0 Z_0 \\
\sigma Z_0^2 \\
\sigma q_1^2 & \sigma q_1 q_2 & \sigma q_1 q_3 & \sigma q_1 q_4 \\
\sigma q_2^2 & \sigma q_2 q_3 & \sigma q_2 q_4 \\
\sigma q_3^2 & \sigma q_3 q_4 \\
\sigma q_4^2
\end{array}
\]
Block Adjustment using RPC + image correction functions

**FUNCTIONAL RELATION**

\[
P = \frac{\phi - \text{LAT}_\text{OFF}}{\text{LAT}_\text{SCALE}}
\]

\[
L = \frac{\lambda - \text{LONG}_\text{OFF}}{\text{LONG}_\text{SCALE}}
\]

\[
H = \frac{h - \text{HEIGHT}_\text{OFF}}{\text{HEIGHT}_\text{SCALE}}
\]

\[
y = \text{Line} = g(\phi, \lambda, h) = \frac{\text{NUM}_L(P, L, H)}{\text{DEN}_L(P, L, H)} = \frac{a^T A}{b^T B}
\]

\[
x = \text{Sample} = h(\phi, \lambda, h) = \frac{\text{NUM}_S(P, L, H)}{\text{DEN}_S(P, L, H)} = \frac{c^T A}{d^T A}
\]

\[
\text{NUM}_L(P, L, H) = a_1 + a_2 L + a_3 P + a_4 H + a_5 LP + a_6 LH + a_7 PH + a_8 L^2 + a_9 P^2 + a_{10} H^2 + \]

\[
a_{11} PLH + a_{12} L^3 + a_{13} LP^2 + a_{14} LH^2 + a_{15} L^2 P + a_{16} P^3 + a_{17} PH^2 + a_{18} L^2 H + a_{19} P^2 H + a_{20} H^3 = a^T A
\]

\[
\text{DEN}_L(P, L, H) = b_1 + b_2 L + b_3 P + b_4 H + b_5 LP + b_6 LH + b_7 PH + b_8 L^2 + b_9 P^2 + b_{10} H^2 + \]

\[
b_{11} PLH + b_{12} L^3 + b_{13} LP^2 + b_{14} LH^2 + b_{15} L^2 P + b_{16} P^3 + b_{17} PH^2 + b_{18} L^2 H + b_{19} P^2 H + b_{20} H^3 = b^T A
\]

The de-normalized image space coordinates \((\text{Line}, \text{Sample})\), can also be computed from:

\[
\text{Line} = y \cdot \text{LINE}_\text{SCALE} + \text{LINE}_\text{OFF} \quad \text{Sample} = x \cdot \text{SAMP}_\text{SCALE} + \text{SAMP}_\text{OFF}
\]

Computed de-normalized image coordinates \((\text{Line, Sample})\)

\* \* Observed image Coordinates \((\text{Line, Sample})\)
Block Adjustment using RPC + image correction functions

\( \text{Line}_i^{(j)} = \xi^{(j)} (\varphi_s, \lambda_s, h_s) + d\xi^{(j)} + \nabla_{Li} \) \hspace{1cm} \( \text{Sample}_i^{(j)} = \rho^{(j)} (\varphi_s, \lambda_s, h_s) + d\rho^{(j)} + \nabla_{Si} \)

With: \( \text{Line}_i^{(j)} \) and \( \text{Sample}_i^{(j)} \) measured image coordinates of a TP or GCP \( s \) with coordinates \( (\varphi_s, \lambda_s, h_s) \)

\( \xi^{(j)}(\varphi_s, \lambda_s, h_s) \) and \( \rho^{(j)}(\varphi_s, \lambda_s, h_s) \) computed de-normalized image coordinates of the GCP or tie point \( s \)

\( d\xi^{(j)} \) and \( d\rho^{(j)} \) Correction Functions to account for the difference between measured and computed coordinates

\( \nabla_{Li} \) and \( \nabla_{Si} \) are random errors. Or:

\( \xi^{(j)}(\varphi_s, \lambda_s, h_s) = g(\varphi, \lambda, h) \cdot \text{LINE\_SCALE} + \text{LINE\_OFF} \)

\( \rho^{(j)}(\varphi_s, \lambda_s, h_s) = h(\varphi, \lambda, h) \cdot \text{SAMPLE\_SCALE} + \text{SAMPLE\_OFF} \)

\( d\xi = r_o + r_s \cdot \text{Sample} + r_l \cdot \text{Line} \) \hspace{1cm} \( d\rho = s_o + s_s \cdot \text{Sample} + s_L \cdot \text{Line} \)

\[ \begin{align*}
\varphi_{Li} + \frac{\partial \varphi_{Li}}{\partial r_o^{(j)}} dr_o^{(j)} + \frac{\partial \varphi_{Li}}{\partial r_s^{(j)}} dr_s^{(j)} + \frac{\partial \varphi_{Li}}{\partial r_L^{(j)}} dr_L^{(j)} + \frac{\partial \varphi_{Li}}{\partial \varphi_s} d\varphi_s + \frac{\partial \varphi_{Li}}{\partial \lambda_s} d\lambda_s + \frac{\partial \varphi_{Li}}{\partial h_s} dh_s = v_{Li}^{(j)} \\
\varphi_{Si} + \frac{\partial \varphi_{Si}}{\partial s_o^{(j)}} ds_o^{(j)} + \frac{\partial \varphi_{Si}}{\partial s_s^{(j)}} ds_s^{(j)} + \frac{\partial \varphi_{Si}}{\partial s_L^{(j)}} ds_L^{(j)} + \frac{\partial \varphi_{Si}}{\partial \varphi_s} d\varphi_s + \frac{\partial \varphi_{Si}}{\partial \lambda_s} d\lambda_s + \frac{\partial \varphi_{Si}}{\partial h_s} dh_s = v_{Si}^{(j)} 
\end{align*} \]

\[ X = (A^T PA)^{-1} (A^T PL) \]

Self-calibration through Additional Parameters

\[ \theta = -c \frac{a_{i1} (Xp - Xo) + a_{i2} (Yp - Yo) + a_{i3} (Zp - Zo)}{a_{i1} (Xp - Xo) + a_{i2} (Yp - Yo) + a_{i3} (Zp - Zo)} + \text{add param} \]

\[ y = -c \frac{a_{j1} (Xp - Xo) + a_{j2} (Yp - Yo) + a_{j3} (Zp - Zo)}{a_{j1} (Xp - Xo) + a_{j2} (Yp - Yo) + a_{j3} (Zp - Zo)} + \text{add param} \]

\[ y = y + P1 \times y \quad y = y + P12 \times \cos(y \times 0.01600) \]
\[ x = x + P2 \times y \quad x = x + P13 \times \sin(y \times 0.03100) \]
\[ x = x + P3 \times x \times y \quad x = x + P14 \times \cos(y \times 0.01600) \]
\[ y = y + P4 \times x \times y \quad x = x + P15 \times \sin(y \times 0.01600) \]
\[ y = y + P5 \times \sin(y \times 0.12566) \quad x = x + P16 \times \cos(y \times 0.01600) \]
\[ y = y + P6 \times \cos(y \times 0.12566) \quad x = x + P17 \times \sin(x \times 0.11) \]
\[ y = y + P7 \times \sin(y \times 0.06283) \quad x = x + P18 \times x \times y \times \cos(K) \]
\[ y = y + P8 \times \cos(y \times 0.06283) \quad x = x + P19 \times y \times y \times \sin(K) \]
\[ y = y + P9 \times \sin(y \times 0.03100) \quad y = y + P18 \times x \times y \times \sin(K) \]
\[ y = y + P10 \times \cos(y \times 0.03100) \quad y = y + P19 \times x \times y \]
\[ y = y + P11 \times \sin(y \times 0.01600) \quad x = x + P20 \times y \times y \]

To avoid over-parameterization the AP are automatically eliminated using a stochastical model:

1. For each AP compute:
\[ t_i = \frac{|p_i|}{\sigma_{p_i}} \quad \sigma_{p_i} = \sqrt{q_{ii}} \cdot \sigma_o \cdot t_i \geq 1, \text{ reject if otherwise} \]

2. Compute cross-correlation coeffs. for the parameters
\[ R_{ij} = \frac{q_{ij}}{\sqrt{q_{ii} q_{jj}}} \geq 0.85 \]
Then eliminate the parameter with smaller \( t_i \) value

3. Compute \( B = I - (\text{diag } N \times \text{diag } N^{-1})^{-1} \); eliminate the AP that \( B_{ij} > 0.1 \text{ or } = 0.85 \)

Bundle Orientation with automatic selection and elimination additional parameters.
Basic QB Image. Area of Atlantic City, NJ
CONCLUSIONS

– Although high attitude frequencies effects are removed at the time of basic image generation, low attitude (Yaw) effects are still present in form of affinity/angular affinity. They are effectively removed by additional parameters

– Bundle block adjustment based on properly weighted ephemeris / attitude quaternions (BBABEQ) are not enough to remove the systematic effects. Moreover, due to the narrow FOV of the HRSI, position and attitude are highly correlated making almost impossible to separate and remove their systematic effects without extending the geometric model (Self-Calib.)

– The systematic effects gets evident on the increase of accuracy (in terms of RMSE at GCPs) for loser and relaxed ground control at the expenses of large and strong block deformation with large residuals at check points. Systematic errors are more freely distributed and their effects propagated all over the block. [No functional model for SE]

– Block adjustment based on RPCs with systematic image correction functions remove significantly the affinity deformation of the basic QB images. Although relaxed ground control produces less accurate results (in terms of RMSE on GCPs) than BBABEQ, the remaining block deformations are much smaller. Increase of absolute accuracy between 65 to 80% can be reported.

– The systematic effects are also noticeable in the internal accuracy of the Block (residuals at pass/tie points). These are smaller for relaxed ground control in the BBABEQ and opposite in the case of RPCs with affine image correction function.
RECOMMENDATIONS

Further Studies need to be carried out to be more conclusive:

1. To conduct accuracy studies on large blocks of images with larger long overlap. This will allow a 3D accuracy study and to increase the reliability of the derived quantities.

2. To extend the model of the BBABEQ to include Self-calibration making use of the co-variance matrices of the Position and Attitude to build-up proper weighting matrix.

3. To include cross track image strips to study the combined effect of multi-rays points and self-calibration on the final accuracy.

4. To extend the RPC model with other image correction functions, including statistical test to ensure the validity of the image correction function parameters to avoid over-parameterization.

5. To test alternative orientation models such as those based on feature matching, i.e., matching of linear features existing on a land data base and extracted from the image space.

6. Others
